Asterisk IAX - a Newbie's Struggle Produces a How-To

IRC: Hubguru@irc.freenode.net/room:#Asterisk
E-mail: Jr.richardson@cox.net

Overview

Intrigued by the proposition of an Open Source PBX, I jumped into Asterisk waters with a summersault. I have years of experience in telecommunications, transport (layer 1, 2&3), PSTN, Routers, Switches, OSS, ATM, TDM, TCP/IP, etc…. This was certainly to be an asset in getting a working system up and running in no-time. That notion couldn't have been farther from the truth. All of my pre-conceptions of how I thought this system actually works were used against me in my own mind. The sparse and emergent documentation was not in a format I was used to seeing and therefore made little sense when bringing together the concepts of the dial plan or IAX setup. I finally managed to get 2 *'s up and running with an IAX connection and successfully completed 4-digit call connections between them. This only after hours of trial and error, reading and re-reading documentation, searching wiki pages http://voip-info.org/wiki-Asterisk and conversing with friendly IRC users: kram, blitzrage & jtodd (thanks guys).

Scope

The scope of this document is to provide my own interpretation of setting up a dial plan to route calls between 2 *'s servers with a 4 digit dial scheme. Included will be example configurations files sip.conf, iax.conf and extentions.conf from each Asterisk server and some explanatory notes within the pertinent context. This document is supplementary to existing documents. Other documentation referenced is a must-read.

Test Setup

Hardware:
2 Dell GXa's, Pentium III 600, 256 Meg Ram, on-board video, sound, NIC. Not using any Zaptel/Digium cards at this time.
1 Cisco 7960 w/SIP ver 4.4 image
1 Cisco ATA-186 w/ver 2.16 image

Software:
Sjphone and X-Lite softphones, Redhat Linux 9, Asterisk (downloaded current version mid June 03)

The 2 computers are loaded with Linux and Asterisk using the following how-to:
http://www.automated.it/guidetoasterisk.htm (Andy Powell)

Both computers/servers were on the same LAN segment with a flat IP scheme.
Server 1 name [Asterisk], IP Address 192.168.1.30
Server 2 name [Asterisk2], IP Address 192.168.1.31

2 X-Lite soft phones installed on Win2K Workstations. These are registered to Asterisk2 (Server #2), IP Address 192.168.1.3 extension [2001] and 192.168.1.4 extension [2002]

Cisco 7960 phone is configured with 6 lines, 3 registered to Asterisk and 3 registered to Asterisk2. IP Address 192.168.1.56 line 1 [2010], line 2 [2011], line 3 [2012], line 4 [1010], line 5 [1011], line 6 [1012]

Cisco ATA-186 configured using:
http://www.loligo.com/asterisk/Cisco/ATA-186-guide.v20030628.txt (John Todd)
Both analog ports have POTS phones attached. The device is registered to Asterisk with 2 lines. IP Address 192.168.1.55 line 1 [1861], line 2 [1862]

Sample Configuration Files & Existing Documentation

These configuration files and existing documents are set forth with experienced literature but when it comes to IAX, the example of providing what is needed on the "other[peer], [user] or [friend] " server (the mate) is unclear, at least for me. Attempted below is a reconciliation of such examples, offering configurations for both servers.

Client Phone Registration
Here is the above mentioned configuration file for both asterisk and asterisk2 denoting successful registration of the above mentioned hardware and software SIP clients.

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

```

XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX

Closing

All that is left is to reload both servers with the added configurations and proceed to test
4-digit dialing between 2 * servers through an IAX link.

Another good document to read is the /usr/src/asterisk/README.iax file located on the
asterisk server.

I encourage those with pre-conceptions embedded from years of working with Nortel,
Cisco and the like to shed them prior to diving into the documents, have an open mind
and keep things simple, because it really is simple to setup IAX. Hope this helps.
